We provide here a CSS file and an xpz (you will use one or the other depending on whether you are using the full version or the Trial version respectively):

1. Semantic-UI-master.gxlibrary: it is the CSS that we have downloaded from SemanticUI, to which we have changed the extension to gxlibrary so that it can be interpreted by GeneXus. You will have to create a File object in GeneXus, to which you associate this file, in order to be able to use it later. You can only do this if you run the full version of GeneXus.

2. TravelAgency_Semantic-UI-gxlibrary.xpz: contains only a GeneXus object of type file, with Semantic-UI-CSS-gxlibrary, that is, with the style base to be used within the KB when the User control Card is created , from SemantiUI. We offer it in case you are using the Trial version of GeneXus, which does not allow you to create File type objects. We already give it to you created.

If you already have the KB in the state in which it was in the video before this one, then with that and the CSS (files 1 or 2) you already have what it takes to reproduce what is shown in the video.

If you don't have the KB in the state it was in the previous video, you can get its xpz by downloading the zip included in the previous video. Or you can directly import the xpz TravelAgencyUCCard.xpz that we attach here that contains the status of the KB at the end of this video. In this case you will not need to import the CSS, since everything will be in the xpz.
