

Automatic Deployment in your own Cloud

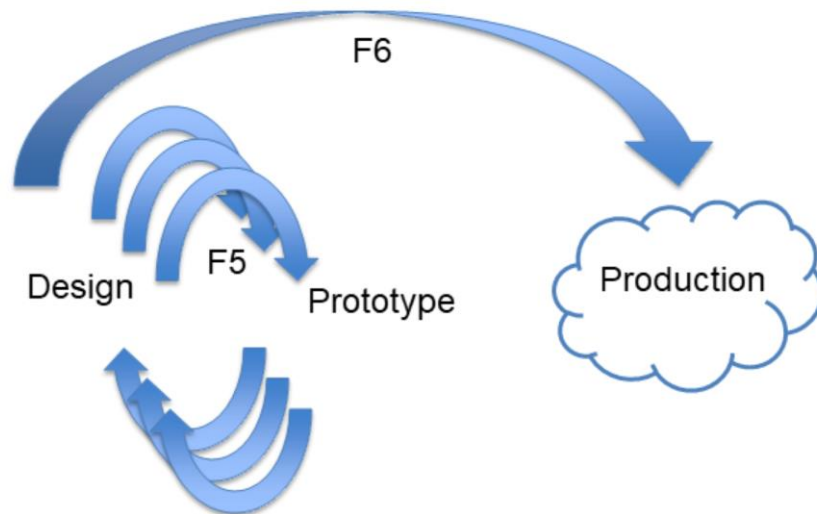

Introduction

GeneXus 16

The deployment process consists of taking the developed application to the production environment where it will finally operate; therefore, this process is an important part in the implementation of a project.

GeneXus provides a tool that is integrated into the IDE for automatic deployment to the cloud services purchased by the client.

Development and production cycle

The developer purchases cloud services and prepares the production environment. Optionally, GeneXus offers consulting services to prepare the production environment in that cloud.

Once this has been configured, from the IDE pressing F6 an automatic deployment is carried out in the prepared environment.

In developing our application, we press F5 many times, because we are going to generate incremental prototypes until we consider that everything works correctly. Then, when we decide to deploy a version, we press F6.

From now on, every time we press F6, the deployed system will be updated.

For more information about the use of F6, read:
