GeneXus Server

Once we're connected to a KB administered by GeneXus Server, we must know how we will interact with this server instance.

This involves the way in which we will send the changes we make, and how we will be able to receive the changes made by other developers.

To do so, we have to select the Knowledge Manager / Team Development options.

Through this dialog box we will be able to interact with a GeneXus Server instance.

Commit

The actions that can be made are as follows:

Commit to Server: This is the operation that will have to be made in order to send the changes made to the KB being administered.

Update from Server: This is the operation that has to be made to receive the changes that other developers have made on the administered KB.
