Examples of possible questions in the GeneXus Proficiency course exam

Here are three possible questions in a GeneXus Proficiency course exam: two are basic level and one is advanced level. The exam will include a combination of simple questions and more complex questions. To answer all of them, it is necessary to have watched the course videos (in those cases where topics are addressed as advanced learning from previous courses, that knowledge will be taken into account as well). Candidates will have more than 10 minutes on average to answer each exam question.

Question 1

An application is being developed for a Hospital (with the transactions indicated, where OfficeVisit represents doctor's visits).

The procedure indicated (which receives two variables by parameter in order to filter the information to be listed) has been implemented and generates the navigation list that is displayed. Indicate which of the following options is true.

Source	Layout	Rules	Conditions	Variables	Help	Documentation	parm(in:	&name,	in:	&dateFro	om);]
Subroutir	nes					~							
	1 🗆 For	each										15	
	2	orde	r Physici	anName w	hen n	ot &name.IsEmp	ty()					-	
	3	orde	r OfficeV	isitDate								/	~
	4	wher	e Physici	anName ≻	= &na	me when not &r	ame.IsE	mpty	()				
	5	wher	e OfficeV	isitDate	>= &	dateFrom when	not &da	nteFr	om.IsEn	npty()		
	6	prin	t printbl	ock1 //P	hysic	ianName, Offic	eVisit	ate,	Shift	lame,	OfficeI	d	
	7 ^L End	For											
											_		
												>	

LEVELS		*
For Each Office	Visit (Line: 1)	*
Order:	PhysicianName WHEN not &name. isempty() No index! <u>OfficeVisitDate</u> OTHERWISE Index: IOFFICEVISIT	
Navigation	Start from: FirstRecord	
Constraints:	PhysicianName >= &name WHEN not &name. isempty() OfficeVisitDate >= &dateFrom WHEN not &dateFrom isempty()	
Join location:	Server	
= <u>o</u> f	ficeVisit (<i>OfficeVisitDate, PhysicianId, ShiftId</i>) INTO PhysicianId OfficeVisitDate OfficeId =Physician (<i>PhysicianId</i>) INTO PhysicianName	

- a. The query that will be sent to the DBMS will be built at runtime according to whether the &name and &dateFrom variables are empty. Probably the only case in which the DBMS will have to run through the entire table is if both variables are empty.
- b. The database query will not be optimized in any case DUE to the presence of when conditions in the Where clauses.
- c. The database query will not be optimized in any case DUE to the presence of a conditional order.
- d. None of the above.

Question 2 (high difficulty, requires knowledge integration)

An application is being developed for a Hospital. It has the transactions displayed, where OfficeVisit represents each visit provided by a physician (Physician) in a given shift (Shift) to see a list of patients in an office (Office).

A procedure has been implemented from which the following navigation list is obtained.

The visit's date should not repeated, so the Source is modified in two different ways, as shown below.

Indicate which of the following statements is true.

Source Layout Rules Conditions Variables Help Documentation \sim 1 = for each OfficeVisit 2 unique OfficeVisitDate, OfficeId 3 &qty = count(OfficeVisitPatientByVideo) 4 print OfficeVisitInfo //OfficeVisitDate, OfficeId, &qty 5 endfor 6 ¥ < >

For Each Office	eVisit (Line: 1)	*
Order: Unique: Navigation filters: Join location:	<u>OfficeVisitDate</u> Index: IOFFICEVISIT <u>OfficeVisitDate</u> , <u>OfficeId</u> Start from: FirstRecord Loop while: NotEndOfTable Server	
= <u>o</u>	fficeVisit (<u>OfficeVisitDate</u> , <u>PhysicianId</u> , <u>ShiftId</u>) INTO <u>OfficeId Of</u> = <u>count(OfficeVisitPatientByVideo) navigation</u> (<u>OfficeVisitDate</u>	ficeVisitDate te, <u>OfficeId</u>)
Formulas		\$
Navigation Given: Index: Group b	n to evaluate: count(<u>OfficeVisitPatientByVideo</u>) <u>OfficeVisitDate</u> <u>OfficeId</u> IOFFICEVISIT by: <u>OfficeVisitDate</u> <u>OfficeId</u>	
	= <u>OfficeVisitPatient</u> == <u>OfficeVisit</u> (<u>OfficeVisitDate</u> , <u>PhysicianId</u> , <u>ShiftId</u>)	

Implementation A

Implementation B

Source	Layout	Rules Conditions Variables Help Documentation	
Subrouti	nes	~	
	1 ⊡ for	each OfficeVisit	
	2	order OfficeVisitDate	
	3	<pre>print OfficeVisitInfo //OfficeVisitDate</pre>	
	4	<pre>&officeVisitDate = OfficeVisitDate</pre>	
	5 🖨	for each OfficeVisit	
	6	order OfficeId	
	7	&OfficeId = OfficeId	
	8	&first = true	
	9	Do "PatientsQty"	
	10 🖕	for each OfficeVisit	
	11 🖕	if &first	
	12	<pre>print OfficeInfo //OfficeId, &qty</pre>	
	13	&first = false	
	14 -	endif	
	15 -	endfor	
	16		
	17 -	endfor	
	18 ^L endf	or	
	19		
1	20 🗆 Sub	"PatientsQty"	
1	21	<pre>&qty = count(OfficeVisitPatientByVideo, OfficeVisitDate = &officeVisitDate</pre>	
2	22	and OfficeId = &officeId)	
1	23 ^L ends	ub	
1	24		~
<		>	

- a. Only implementation A meets the requirement.
- b. Only implementation B meets the requirement.
- c. Both implementations meet the requirement.
- d. None of the implementations meets the requirement.

Question 3

An application is being developed for a Hospital (with the transactions indicated, where OfficeVisit represents doctor's visits).

Given the procedure displayed, choose the correct answer from the options given below.

Source Layout Rules Conditions Variables Help Documentation	
Subroutines ~	
<pre>1 = For each 2 where OfficeVisitDate = &today 3 print Printblock1 //ShiftName, OfficeDescription 4 = For each 5 print Printblock2 //PatientName, MedicalSpecialtyName 6 - endfor 7 - endfor</pre>	- 14 14
8	> `

- a. Main For each Base table: OfficeVisit Nested For each Base table: OfficeVisitPatient
- Main For each Base table: OfficeVisit
 Nested For each Base table: Patient, where the value of MedicalSpecialtyName will be shown empty because it cannot be reached from Patient.
- c. It will give an error, due to the presence of the MedicalSpecialtyName attribute in the nested For each.
- d. None of the above.

Question 1: a)

Explanatory text: In the video "Order clauses and performance" we saw that the navigation list shows the most conservative strategy, not the real one. This is especially so in the case of conditional clauses because the SQL query that the source program will send to the DBMS will be dynamically built depending on the values of the when conditions. In addition, we know that if it is sorted by the same attribute as the one used to filter, it is highly likely that the query will be optimized.

Question 2: b)

Explanatory text: Knowledge about the limitations of the unique clause (which cannot be used to implement control breaks) is integrated with knowledge about how to implement a triple control break, and how to use a subroutine to break the context so that unwanted implicit conditions are not added to an aggregate formula. Unique clause video

Question 3: a)

Explanatory text: To determine the base table of the nested For each, from all the attributes involved (not those of possible when duplicate or when none clauses, nor those of a Data Selector used with the in operator), the ones that already belong to the extended table of the main For each are extracted. In the remaining ones, the minimum extended table containing them is searched for.
